

Metadata Aggregation

Ian A. Young

SDSS, EDINA, University of Edinburgh

FAM09, Cardiff, 23-Nov-2009

What to expect

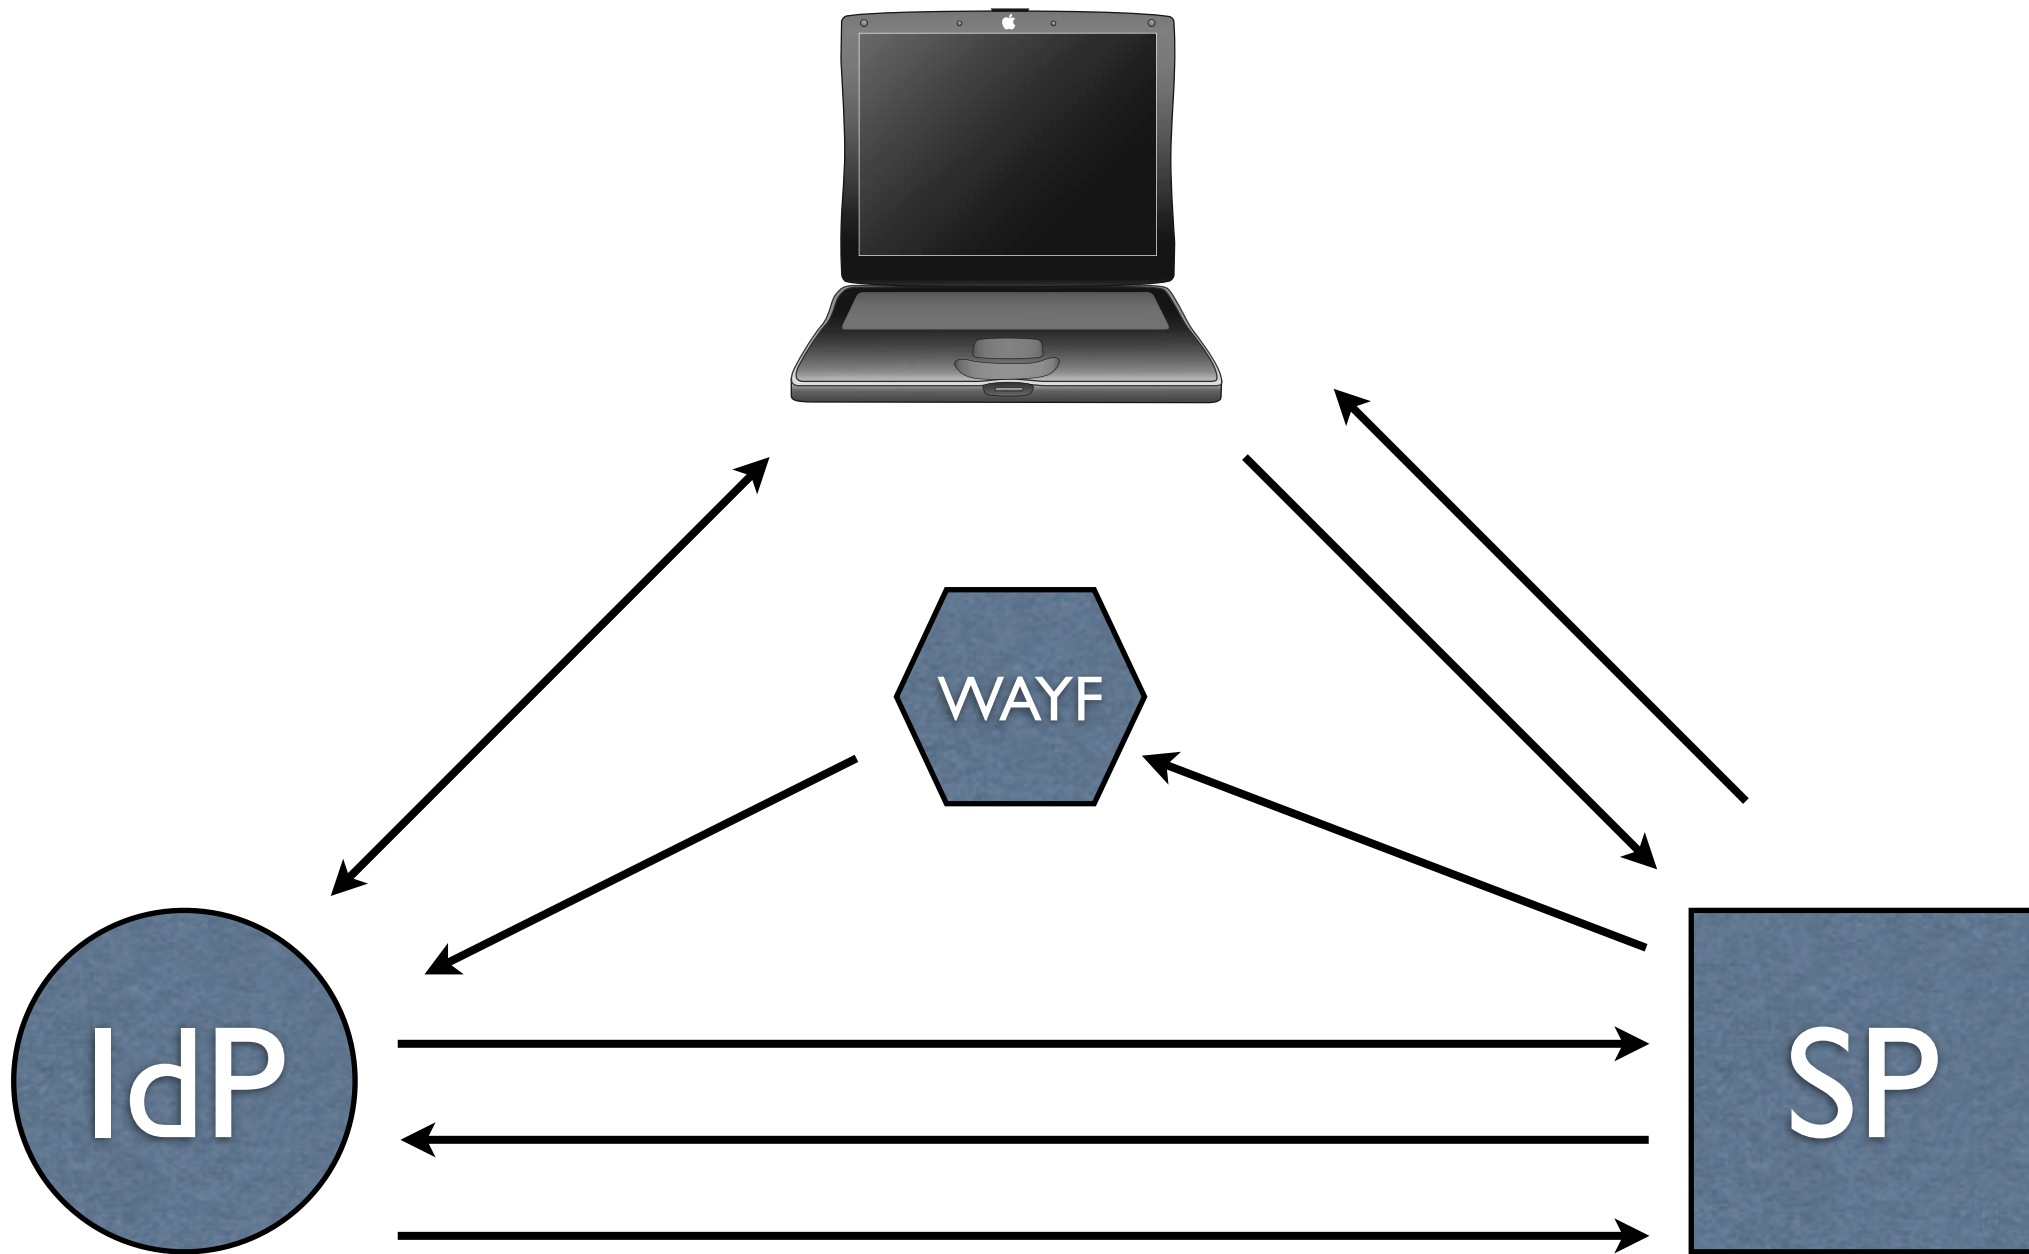

- Federated identity in a multi-federation world.
- Metadata aggregation: a technical approach.
- Aggregation engines: specific technology.
- Conceptual shifts are needed.

Dramatis Personae

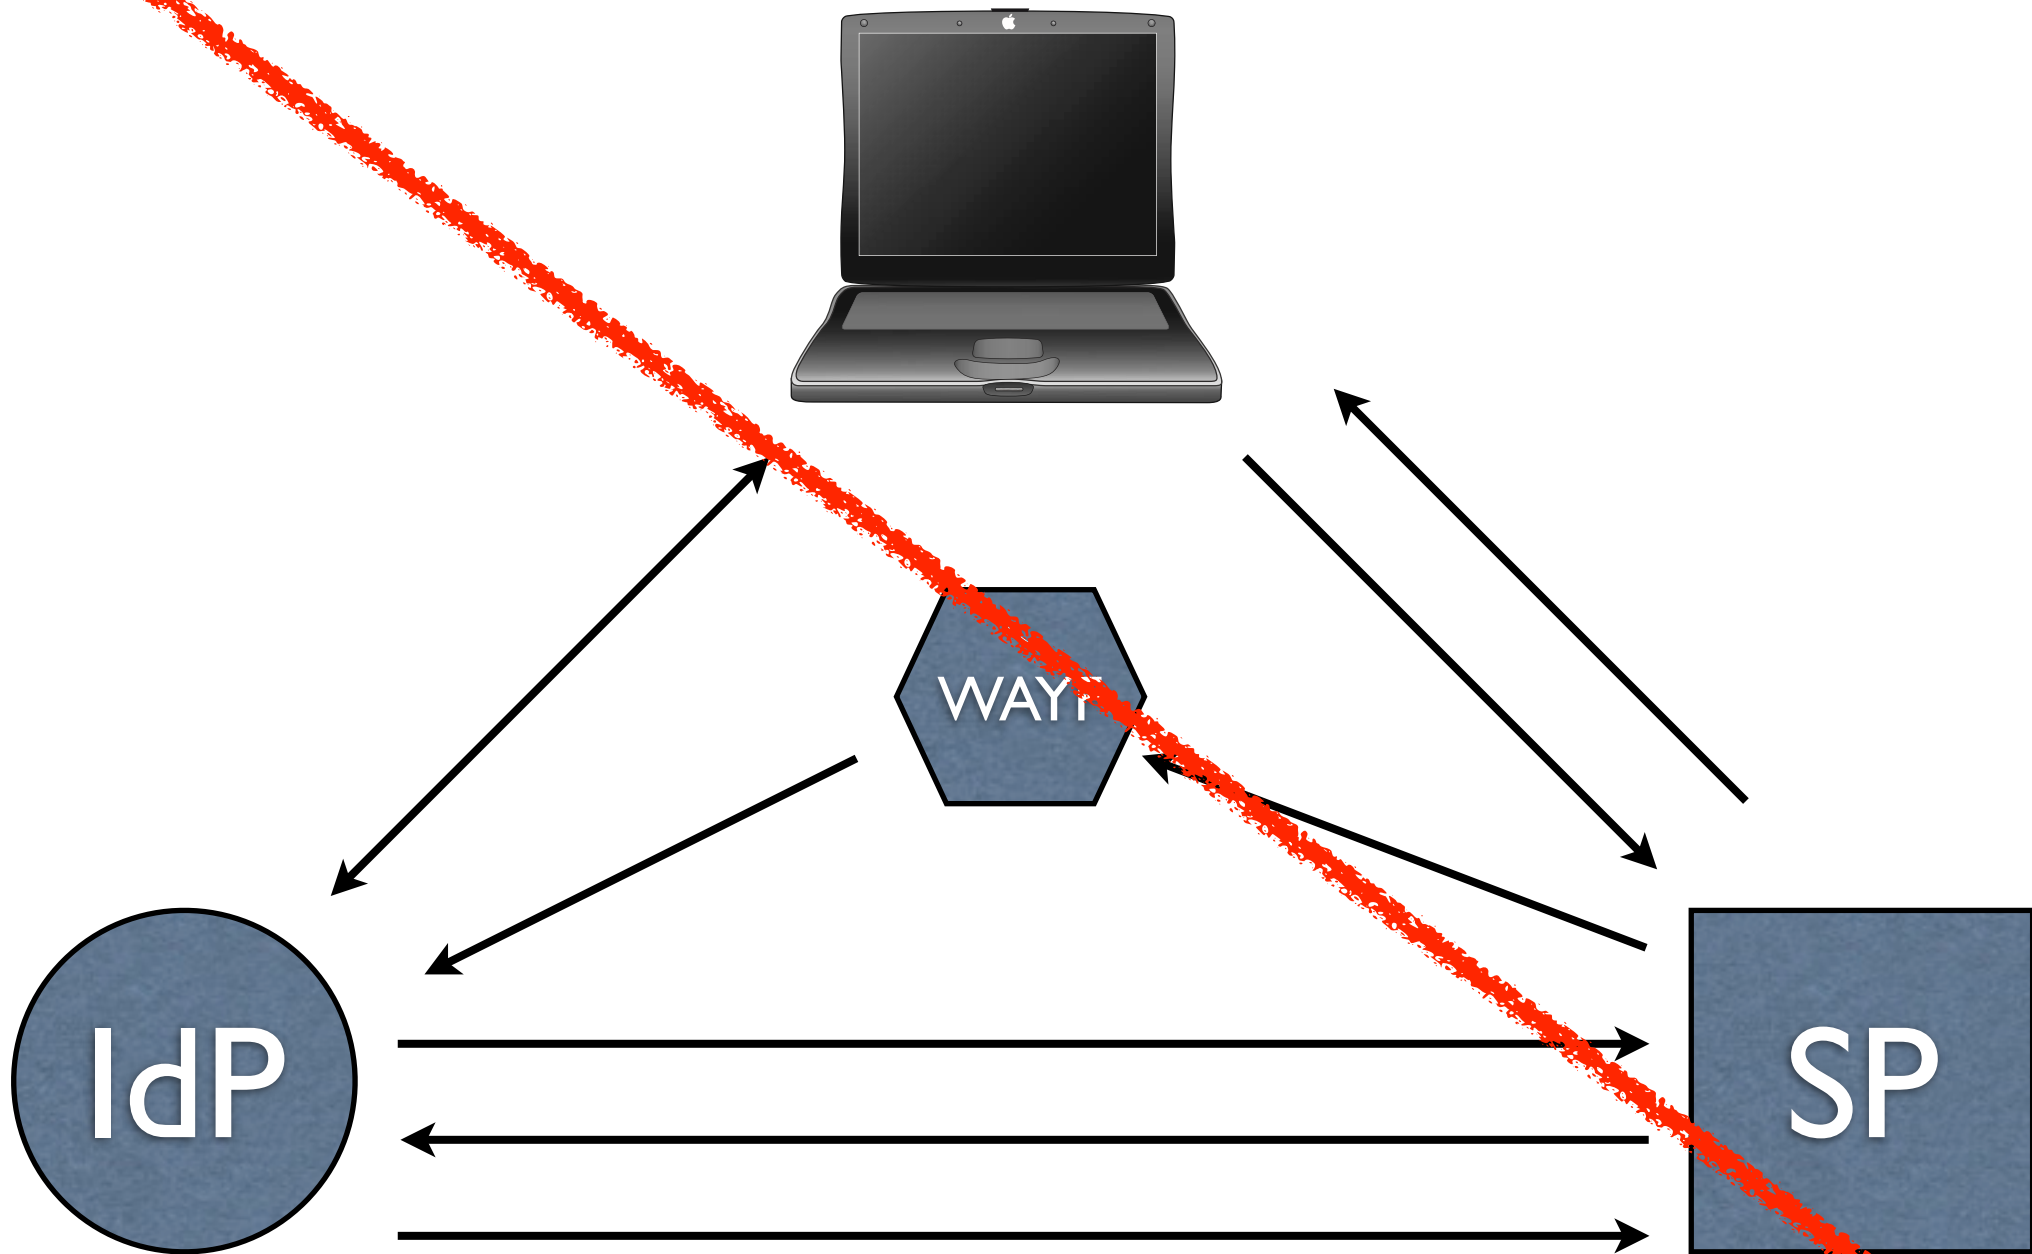

- *Alice*, an *entity* and trusting friend of
- *Bob*, a second *entity*, desirous of conversation with Alice;
- *Sally*, the *subject* of their conversation;
- Sundry *languages*, *cryptosystems* and other *technologies* in attendance.
- (Hopefully) a *chorus* of interesting *questions*.

Rethinking Federation

Rethinking Federations

“That” Federation Diagram

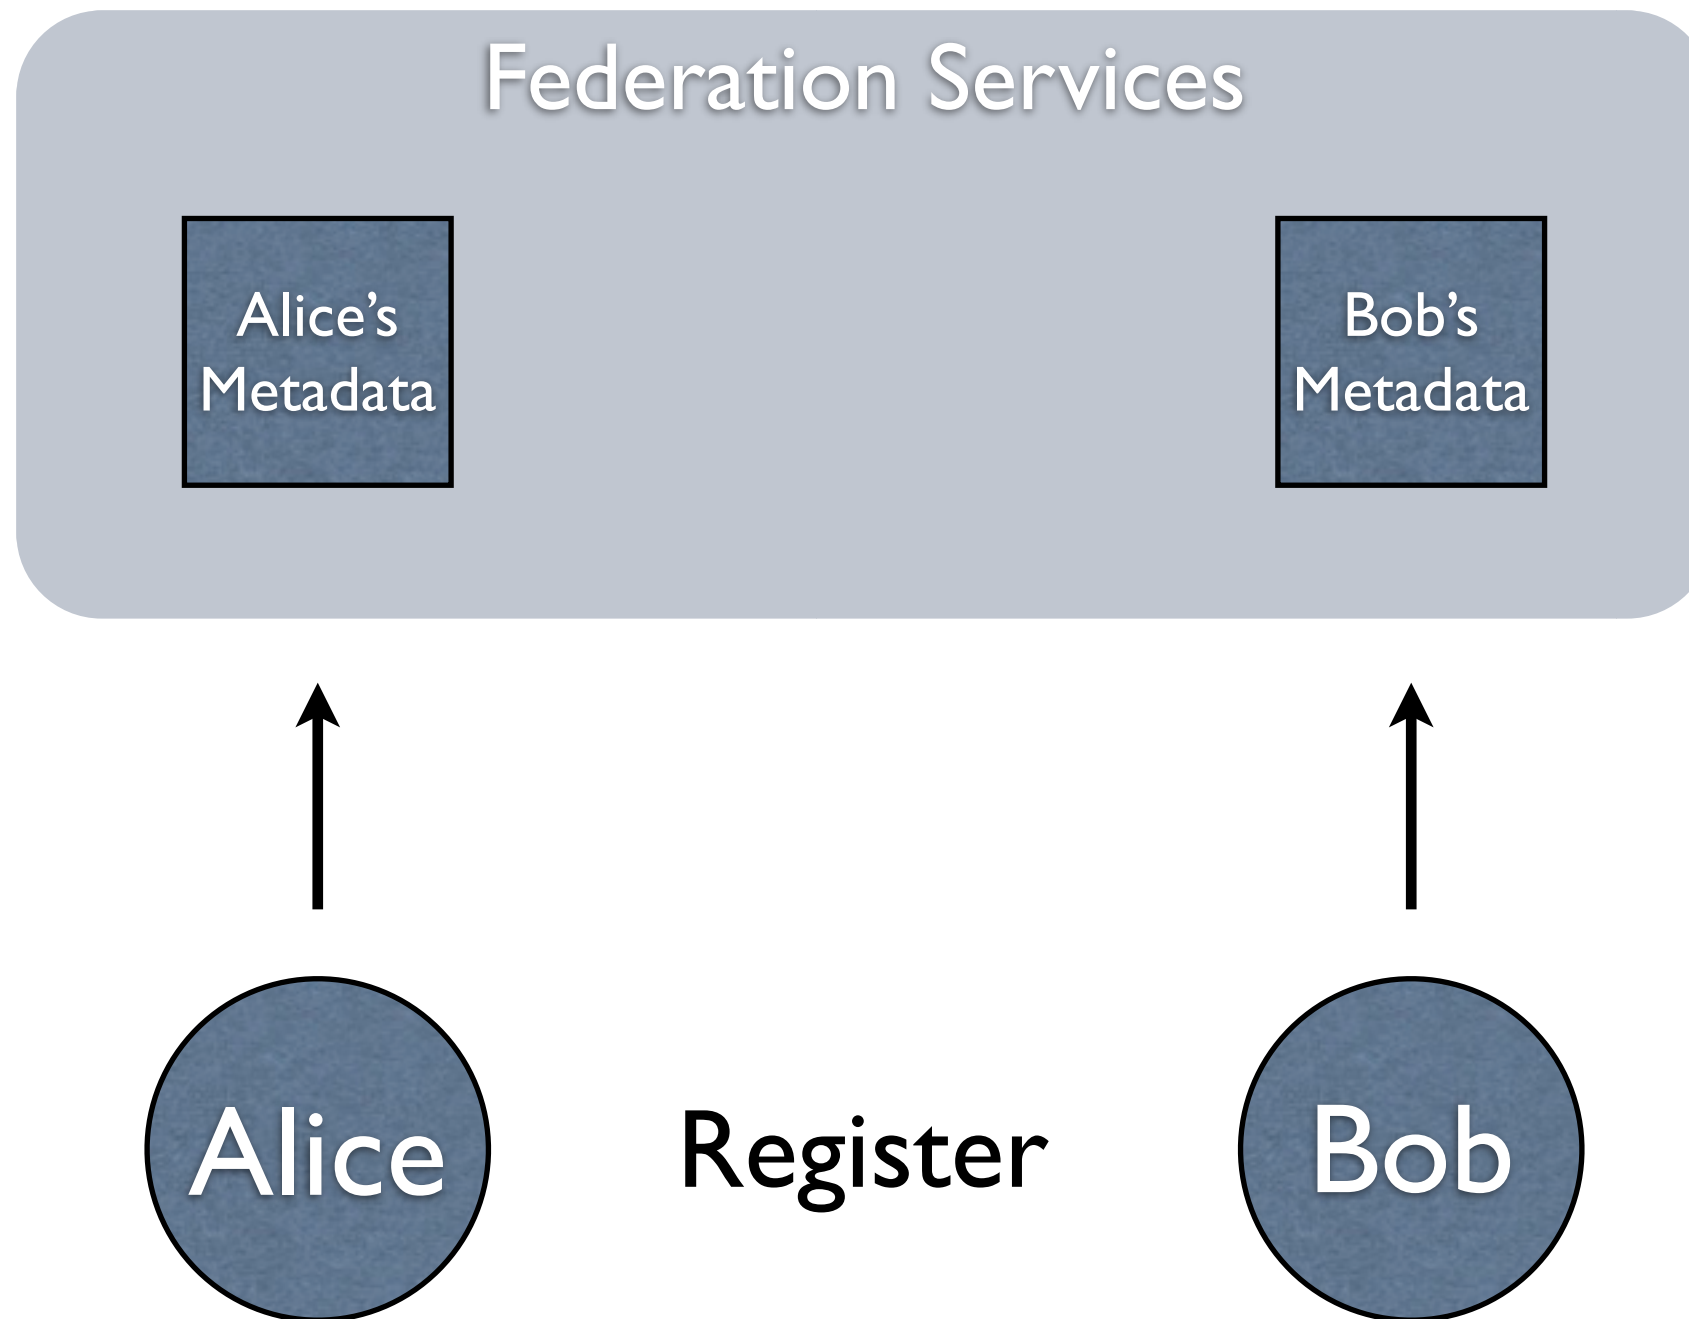

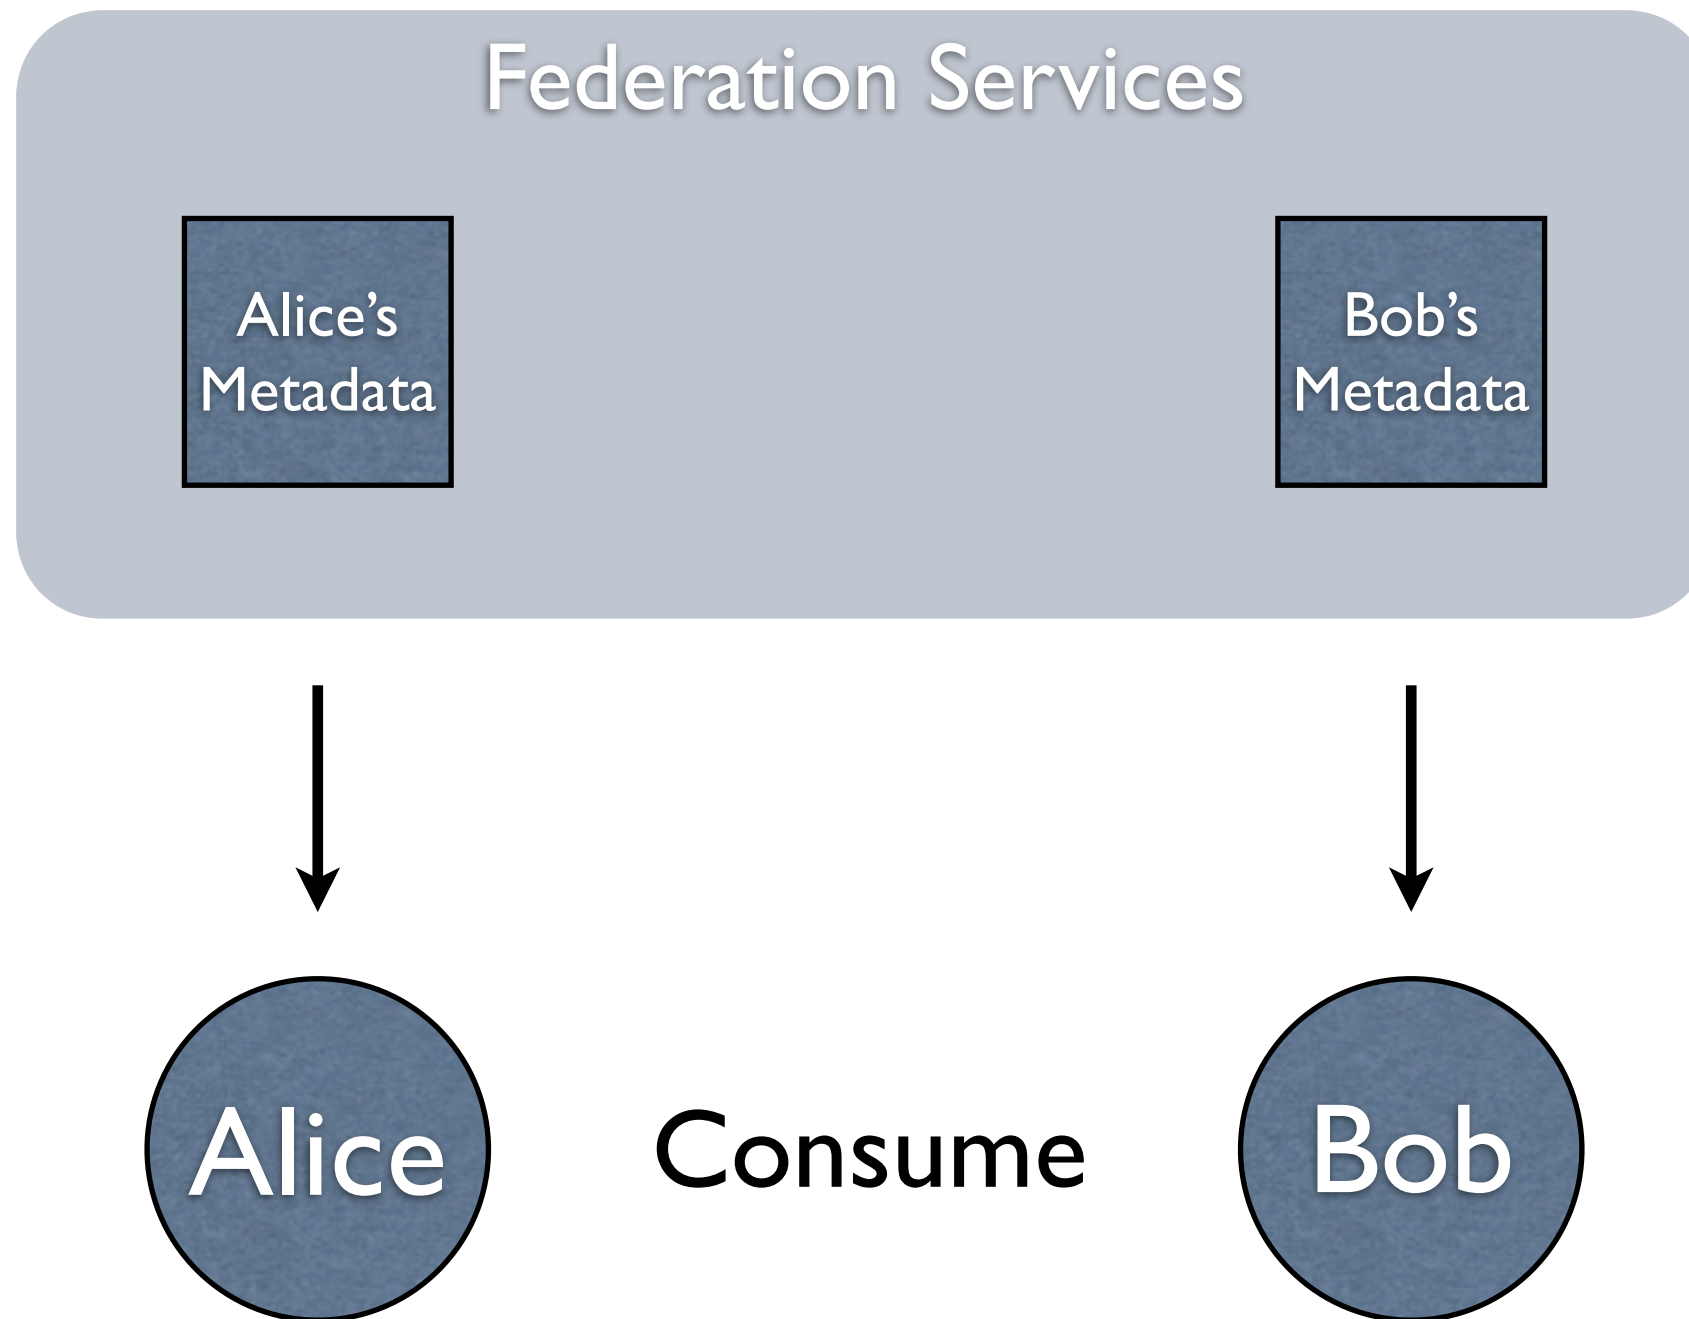

“That” Federation Diagram

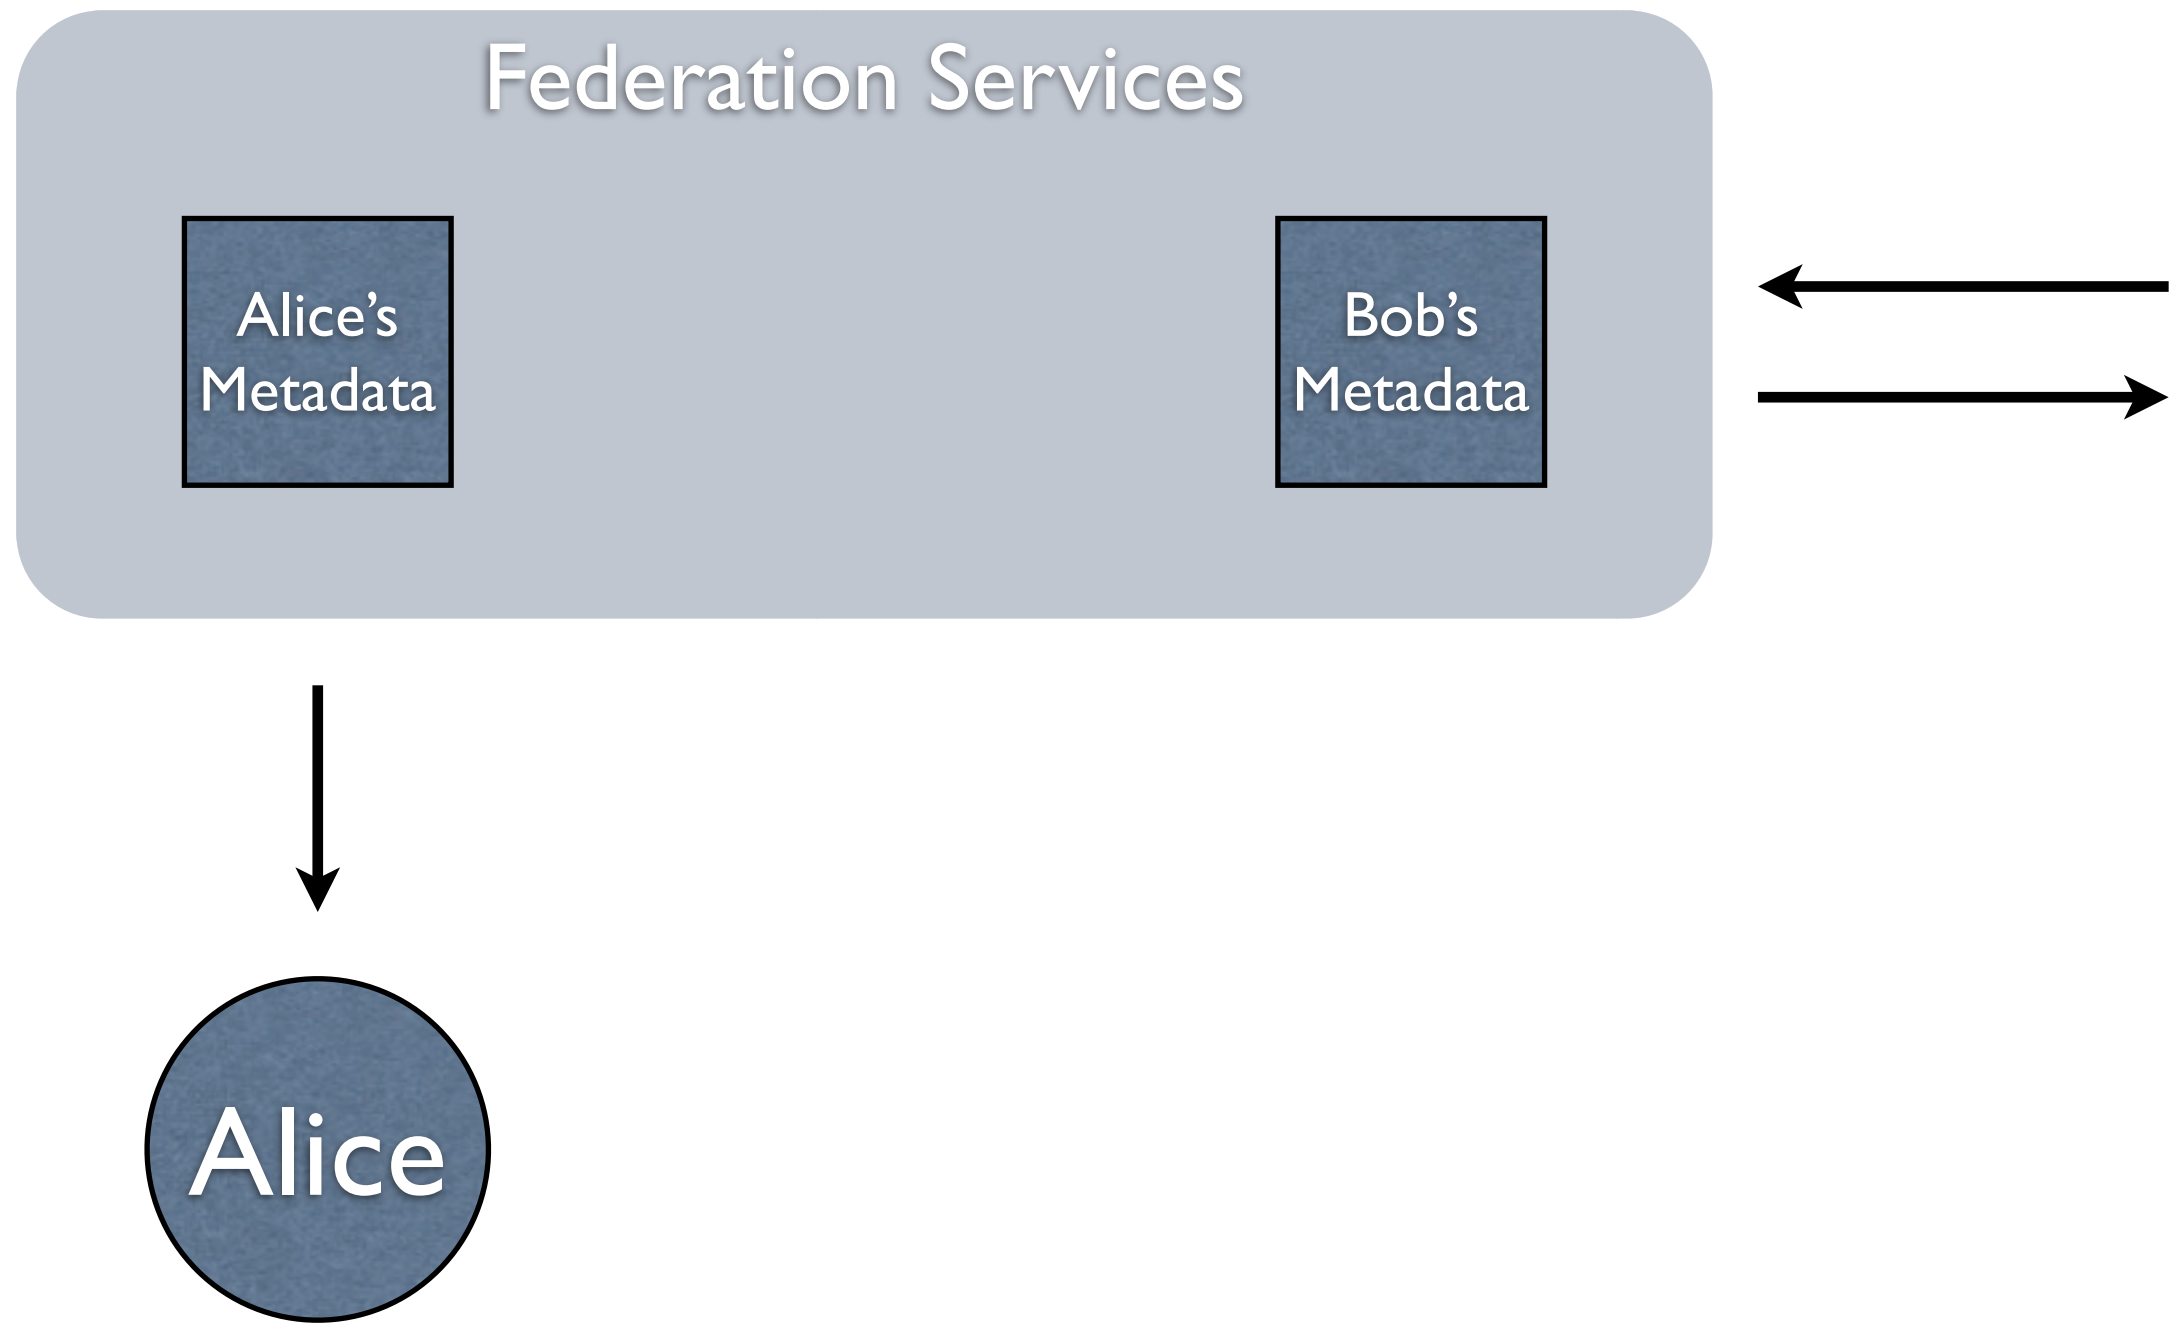

Federations

- Primarily social, not technical, structures;
- Do not contain entities, but members;
- *Enable* communications by providing services;
- Many services involve being *trust brokers*.

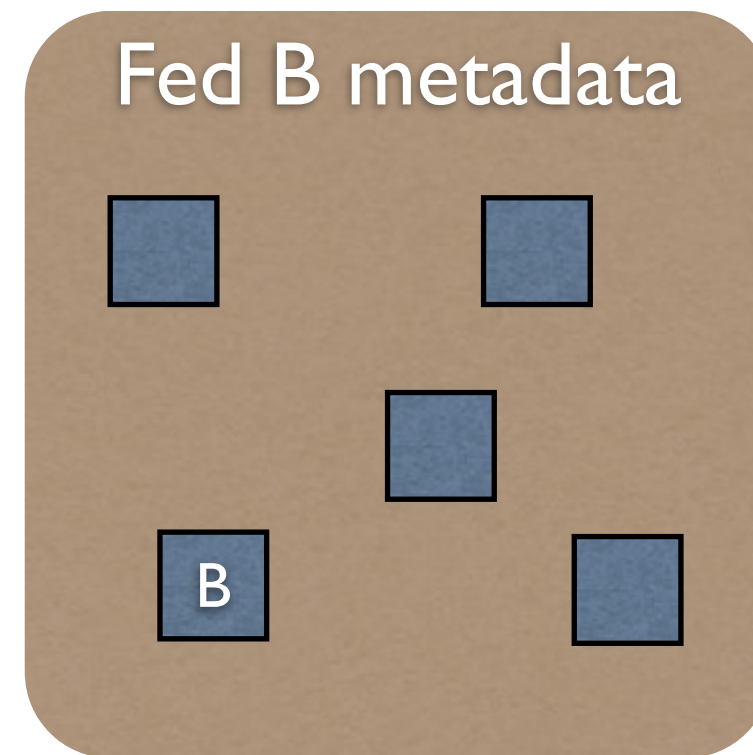

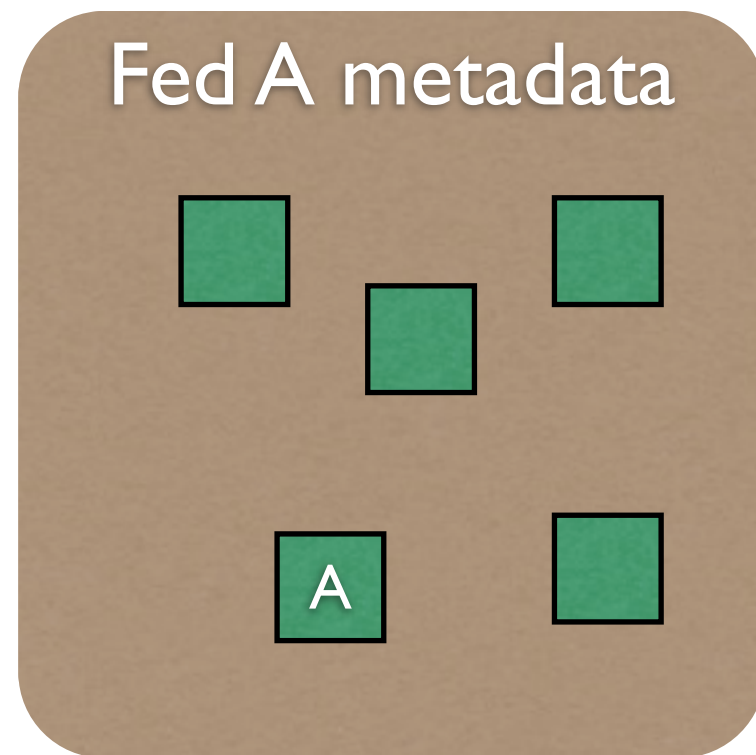

Bilateral Exchange

Aggregation Engines

- A configurable building block for “metadata networks” or “metadata layer”:
 - Subscribe,
 - Aggregate,
 - Transform,
 - Publish.

Transformation Steps

- Whitelist and blacklist by entity ID
- Whitelist and blacklist by XPath matching
- Digital signatures and signature verification
- Arbitrary XSLT
- Scripting languages
- ... or anything else you want to create

Result...

- All entities have access to (trustworthy) metadata for all potential partner entities.
- This can be seen as a “metadata layer” analogous to the DNS “naming layer”.

Scaling

UK federation entities

Metadata Size (Total)

Scaling

- Observation: the UK federation is still getting bigger.
- Observation: the whole world is bigger still.
- If everyone has access to everything, won't that become "too big"?
- Response: don't download everything!
- Move to entity-at-a-time distribution.

I didn't mention...

- Behavioural trust in large systems;
- Trust relationships between aggregators;
- The discovery problem.
